---

schemas are just plain objects, it's easy to see why they would be so popular in this ecosystem (and have so many supporters on Stack Overflow). I find that I don't always try to translate an already existing schema into an object to pass to a mongoose function. Is that the same thing as using the

`Document.create` method instead of defining your own schema object? So, is it worth it to implement a schema translation layer if your only intention is for Mongoose to create and use the schema object? Or does it simply boil down to your personal preferences? A: Please refer to the documentation for more info. It's worth noting that by default Mongoose doesn't create a schema object if no model is defined. So the answer to your question would be "it depends on what you are trying to do." If you do plan on defining a model using mongoose, the answer is "yes, translate the schema into an object and then use it." If you aren't, the answer is "don't." [Chrono-administration of recombinant granulocyte-macrophage colony-stimulating factor (rGM-CSF) for hematopoietic support in the patients undergoing allogeneic hematopoietic stem cell transplantation].

Granulocyte-macrophage colony-stimulating factor (GM-CSF) increases the number of granulocyte and macrophage and promotes their differentiation in vitro. To investigate whether the chrono-administration of rGM-CSF may improve hematopoietic recovery following allogeneic hematopoietic stem cell transplantation (allo-HCT), we performed retrospective analysis of the time when the peak value of white blood cell (WBC) count was attained in 111 patients after allo-HCT. Based on these data, the patients were divided into 3 groups (groups A, B, C) and were further divided into early and late post-transplantation subgroups. The WBC count showed significantly higher peak values at day +3 in group A (n=48) and group B (n=27) than in group C (n=30). The area under the curve (AUC) of 2d92ce491b
