
Move the main components: Frame connectors, Pairs of wheels, pivots and cylinders . Complete Wording and Formula for crane and hoist. If you need additional information or assistance please email crane@essex.co.uk. Category:Kits
Category:Construction equipment of the United Kingdom Category:Physical training

Mapping of the myosin heavy chain gene promoter in the chicken and in its cell line DF-1. The chicken myosin heavy chain (MHC) gene has been shown to be expressed in a regulated fashion, being restricted to skeletal muscle cells. In this work the myosin heavy chain gene (MHC) promoter from the chicken was mapped and cloned. The 5'-flanking region is about 7.5 kb long and harbors a TATA-box. A piece of about 1.3 kb has been deleted in the human MHC gene, this deletion probably being responsible for the low expression of the muscle specific isoform in non-muscle tissues. The chicken MHC promoter contains an identical deletion. It is possible that the promoter in other species may be functioning in a tissue-specific manner. The promoter region of the chicken MHC gene was cloned in the vector pGEM-7Zf. Cotransfection of chicken DF-1 cells with the MHC gene promoter linked to the beta-galactosidase reporter gene and the CMV promoter in pBluescript SK+ was done to identify positive regulatory elements.
