

---

is a form of malicious attack that can be carried out against a single device or. If the site was used to collect diagnostic data, the site's IP address can be determined. This is especially true for blacklist attacks, which can be used to spread malware. If the attacker uses IP addresses in the attack or connects to the selected site himself, this means that the attacker can use the resources of any active user for his own needs. Requests on behalf of all server users It is possible that anonymous attackers are trying to access resources using arbitrary requests on behalf of system users. In this case, both IP-telephony and conventional analog lines are used. To ensure security, you should additionally install a firewall that separates computers on the network and prohibits the transmission of IP packets over the LAN interface. Surprise attacks At the moment, there are many ways that can lead to the need to activate protection. But it is important to remember that it is worth protecting yourself from an attack made by an attacker. In no case should you connect to a computer on IP links unknown to you. A serious security risk is the use of invalid commands and passwords. These vulnerabilities could be exploited by an anonymous user to gain access to a resource. Let's take such an attack as an example. The user enters the site, logs in, gets access to the system. At the time of authentication, it sends a specific request to the site server. After that, an attack is made. This entire Trojan program is stored in the boot sectors of the hard drive, and then in user sessions, where logins and passwords are stored. When sending requests to the server, the computer may become infected with a virus, as well as accept attempts to reach the server. All this leads to the fact that the system simply cannot connect to the server, and therefore, to the browser and files. After that, it becomes available without any action on the part of the victim. One way to solve the problem is to use a modifier on the Windows command line and the Chrome browser, with which the user will be able to restore access to the network after protection is installed. First of all, you need to go to the "Control Panel" and go to the "User Accounts" section. You will be able to set a password. The default value will be set for all computers on the network. You need to select "Basic". After the user selects the correct password, you will be prompted to select the required login and password for authenticated login
