What does Photoshop stand for? When the software was first released, it was called PhotoShop (because it was for photography), but from version 6, it was called Photoshop. The reason for the switch is the development team couldn't come up with a good enough name, so it evolved to Photoshop. Initially, the company chose the name Photoshop for a number of reasons. It stands for photorealistic image manipulation software. The name was "inspired" by the approach that evolved into the image manipulation and retouching applications that we use today. But instead of manipulating one image, it was something that could adjust, adjust multiple images. It was also a slang term for something creative, and it was a multi-use word that could not be trademarked. Also, it was a name which made it easy to identify. "Photoshop" was trademarked, but the company wanted to keep it free for use by other non-commercial purposes. When Adobe acquired the company in 1998, it was difficult to trademark the name because of those use cases. When they asked people what they thought the trademark would be, Photoshop was the most popular answer so it became available for use, while Photoshop CS is the trademarked name. If you're using Photoshop, will it always remind you of the software's name? Even though Photoshop is not as common as photoshop or Photoshop Elements, it's still an incredible piece of software and used by millions of people around the world. What does Photoshop stand for? It was first released in 1987 and has been a household name ever since. It is a PC software company based in San Jose, California, and was founded by a bunch of guys from the Lawrence Berkeley Lab. In a talk titled "Photoshop and Beyond," Chip Forrest, Photoshop's creator, spoke at length about his history. He talked about the origins of Photoshop, about what prompted him to be a developer, how he made money and more. The story behind the Photoshop trademark Originally, Adobe tried to keep the name Photoshop and have it trademarked. This time around, the 388ed7b0c7

Photoshop 2021 (Version 22.5) Download [April-2022]

Although Adobe Photoshop has a number of options available, a photoshop retouching tutorial typically starts with the Clone Stamp, and uses it to clean up a photo. The following tutorial will show you how to build a basic photo retouching tutorial using the clone stamp, along with using the healing brush and dodging, burning, and dodging tools. The first thing you'll want to do is make your image, which will serve as a canvas for creating the finished product. The image of a cracked road is used in this tutorial. 1. Download the image from the Advanced Photoshop section here. The texture is found in the files section. 2. Using your web browser, open the image in the Photoshop interface. When it's open, you'll see a flat gray area on the canvas. This means you have no layers yet. 3. Click on the New Layer icon at the top of the Photoshop window. 4. Using the Rectangular Marquee Tool, drag a new layer over the gray area. 5. Save the image as a GIF or TIFF file. You will use this file for a later step, but first, we'll create a new layer and start to clean up the road. 6. Using the Lasso Tool, select the right side of the road. Use the Eraser Tool to delete unwanted part of the road. 7. We want to fill the space with a black color, so we can see the road. Start a new layer by pressing the A key on your keyboard. 8. Click the Fill with: button on the interface and choose Black from the dropdown menu. 9. Using the Stroke selection tool (created in step 4), select the area you want to be filled. 10. Repeat steps 7-9 for the entire road. 11. If necessary, go back to steps 7-9 and fill in more areas of the road with black. 12. Hit Enter to exit the black fill mode. Make sure the road is highlighted in the Layers window. 13. Click on the eye icon at the bottom of the Layers window. This will toggle the visibility of the layer. Click on the eye icon again to turn it back on. This will hide the layer.

What's New In?

The present invention relates to surgical gloves, and, more particularly, to surgical gloves used by surgical personnel in operating rooms and the like. The prime function of surgical gloves is to protect the wearer from the hazards of the surgical field, including blood, body fluids and other fluids, and foreign objects. Because of this, surgeons must carefully match the properties of gloves to the character of the exposure they will encounter. For example, surgical gloves used in a blood-filled field must be able to withstand a significant exposure to blood and bloodborne pathogens without breaking down, and must permit the gloved surgeon to apply force to a surgical instrument while it is performing a surgical procedure or where the glove is otherwise in contact with the surgical instrument. In addition, surgical gloves should permit the surgeon to move freely while wearing the gloves, and should fit comfortably when they are worn. In an article by A. I. Nijenhuis et al., titled "An Evaluation of Three Elastomeric Surgical Gloves" (Journal of Aeromedical Research, 1989, Vol. 8, No. 3, pp. 173-183), the authors conducted a study of the properties of various surgical gloves including latex, nitrile, and polyurethane. They found that latex gloves were strong, but they described their latex gloves as being slippery, which made them unsuitable for use in some surgical procedures. The nitrile gloves exhibited good grip and were suitable for use in surgery where movement is required, but they do not bond to the skin and may tear during use. Polyurethane gloves were less slippery than nitrile gloves, but were not satisfactory in that they tended to break down quickly. In recent years, latex surgical gloves have been replaced in many surgical procedures by polyurethane surgical gloves. In "Serum Latex and Polyurethane Blood Contamination of Polyurethane Gloves" (Journal of Hospital Infection, 1990, Vol. 20, pp. 587-590), the authors note that, although latex gloves are often preferred by surgical personnel, the use of latex surgical gloves has been associated with a number of disadvantages, including the presence of an elastomeric coating that allows latex to spread through the glove and ultimately into the surgical wound. In the article, the authors describe how, over time, the use of latex surgical gloves results in the release of the entire coating into the surgical wound. It has been reported by P. L. Hahn et al., in a paper
